2 1 INTRODUCTION

# 1 Introduction

When a group of users have a computer in common use, the users tend to take up all the available disk-space, thereby making the system useless. It is an example of the "tragedy of the commons"[1]. To avoid this problem, a "quota" system can be set up that limits the the amount of disk-space that a user may occupy. This document describes and sets up a script that adapts the user-quota to the amount of disk-space that is still free. Initially, when there is sufficient disk-space, the quota is set to a large value ("begin-quota"). When the free disk-space decreases below a given thresholt, the quota-system sets in and reduces the user-quota slowly until there is enough free space. When a large fraction of the disk is free, the quota are gradually increased, until "begin-quota" is reached.

The script can be implemented as a "cron" task.

In our computer, we discern two user groups, regular users and students/guest, who may use the computer temporarily for specific projects. The students are allowed a smaller amount of quota than the regular users.

#### 1.1 Quota settings

When there is plenty of free-disk-space, there is no need for a tight limit. Usually only few users need a really large amount of disk space, so let us set the absolute maximum quota to one fifth of the capacity of the disk. Let us assign a max amount of one tenth of that to students.

It is difficult to manipulate floating-point numbers in this script, therefore we will use percentages. Set the percentage of free space below which this script will reduce the quota and the percentage above which the script will possibly increase the quota:

```
⟨ quota settings 2b⟩ ≡
    minfreespace_perc=5
    maxfreespace_perc=30
    ⋄
Fragment defined by 2abc, 3a.
Fragment referenced in 5c.
Defines: maxfreespace_perc 6c, minfreespace_perc 6c.
```

When free space is too little, the script reduces the quota to reduction\_perc percent of the original value. When free space is abundant, the script may expand the quota with expansion\_perc percent.

The Unix quota system knows, besides the hard limit of allowed disc-space usage, a soft limit. If a user exceeds the soft limit, she will get warnings.

#### 1.2 Regular users and students

The users of the computer are divided up in a group "user" (with group-id 100) and a group "studs" with group-id 1035. The group-id is the fourth item in the "passwd file" (/etc/passwd).

To find a username and a group-id in a line of /etc/passwd, the following macro's can be used. The first argument (@1) represents the line from /etc/passwd and the second argument represents the username resp. group-id:

### 1.3 Store/retrieve the quota settings

The script that we make will set quota for the two user-groups. The new settings will be communicated to the quota-system of the operating system, but it is convenient to store the settings in a file that can be read the next time that the script starts.

Therefore, generate a file kyotoquota in directory /usr/local/etc. Write the following line in that file:

```
userquotum: XXXXXX
```

where XXXXX signifies the actual user-quotum.

The following two functions, store\_quota and read\_quota store quota in a file resp read the quota from a file:

Function store\_quota accepts a quota set-value as arguments and generates a new file.

4 1 INTRODUCTION

```
⟨ functions 4a⟩ ≡

function store_quota {
    quotum=$1
    echo "userquotum: " $quotum > /usr/local/etc/kyotoquota
    }
    ♦

Fragment defined by 4ab.
Fragment referenced in 5c.
Defines: store_quota 7b.
```

Function retrieve\_quota reads file, tries to find a line that begins with userquotum:, reads the quota setting from that line and assigns it to variable old\_userquotum. If the file does not exist or the file does not contain the quota setting, the function writes the empty string in old\_userquotum.

```
\langle functions 4b \rangle \equiv
      old_userquotum="" # Set global scope.
      function retrieve_quota {
         old_userquotum=""
         if
           [ -e "/usr/local/etc/kyotoquota" ]
         then
           while
             read line
             do
               parametername=${line%%:*}
               if
                [ "$parametername" == "userquotum" ]
                  old_userquotum=${line##*:}
                  break
             done </usr/local/etc/kyotoquota</pre>
        fi
      }
Fragment defined by 4ab.
Fragment referenced in 5c.
Defines: old_userquotum 7bc, 8a, retrieve_quota 7c.
```

### 1.4 The quota system

The command repquota obtains information about the quota of users. The following shows an example of use:

```
huygen@kyoto:~/projecten/kyoto/quota/kyotoquota/nuweb$ sudo repquota / [sudo] password for huygen:

*** Report for user quotas on device /dev/vda3

Block grace time: 00:00; Inode grace time: 00:00

Block limits File limits

User used soft hard grace used soft hard grace
```

```
[..]
brasser
              554012 81895040 102368800
                                                   3241
                                                             0
                                                                   0
                                                  107543
                                                             0
vossen
          -- 29239788 81895040 102368800
                                                                    0
              189764 81895040 102368800
                                                     38
                                                             0
                                                                   0
segers
```

So, the command results in a table with the name of the user in the first column, the "soft block-limit" in the fourth column and the "hard block limit" in the fifth column.

Hence, to obtain the current hard block-limit of a user, find the fifth column in the line that starts with the name of the user:

```
\label{eq:continuous} \langle \mbox{ get hard quotum of user } 5a \rangle \equiv & & @2=\text{`repquota -vu / | grep "@1" | gawk '`{print $5}'`` $$$} 
  \diamondsuit  Fragment never referenced. Uses: print 15a.
```

Modify the quota of a user with the following macro. Arguments

- 1. (Q1) Name of the user.
- 2. soft block-quotum
- 3. hard block-quotum

```
 \langle \; set \; quota \; of \; a \; user \; 5b \; \rangle \equiv \\  \qquad \qquad \text{setquota -u @1 @2 @3 O O /} \\  \qquad \qquad \diamond
```

Fragment referenced in 9a. Defines: setquota Never used.

# 2 The script

The script works as follows:

- Find out the amount of free diskspace.
- Determine whether the quota must be reduced or increased.
- If so, perform the change.

When argument -1 is provided, the script will print a summary of the numbers.

```
"../adaptquota" 5c≡
#!/bin/bash
# adaptquota -- adapt user-quota to amount of free disk space
# usage: adaptquota [-1]
# -1: perform logging
⟨ set logging 9m⟩
⟨ variables 3b⟩
⟨ functions 4a, ...⟩
⟨ quota settings 2a, ...⟩
⟨ find out free diskspace 6a, ...⟩
⟨ determine whether quota should be reduced or possibly expanded 7a⟩
⟨ expand or reduce quota 7b⟩
♦

Uses: logging 9m.
```

6 2 THE SCRIPT

# 2.1 Find out free disk-space

Use Unix command df to find out the capacity of the disk and the amount of disk-space that is still free. An example of the result of the df command:

```
huygen@kyoto:~$ df /dev/vda3
Filesystem 1K-blocks Used Available Use% Mounted on /dev/vda3 511844016 406344896 79475852 84% / huygen@kyoto:~$
```

So, it seems that the second word of the second line of the output gives us the total disk capacity and the fourth word gives us the remaining capacity.

To perform integer arithmatic with the obtained data, let us create variables that represent one percent of the capacity. To do this, chop off the two rightmost digits:

 $\langle find \ out \ free \ diskspace \ 6c \rangle \equiv$ 

Define min-diskfree, the amount of free disk-space below which the quota will be restricted and max-diskfree above which the quota might be expanded.

```
min_diskfree=$((minfreespace_perc*$disk_capacity_onep))
       max_diskfree=$((maxfreespace_perc*$disk_capacity_onep))
Fragment defined by 6abcd.
Fragment referenced in 5c.
Defines: max_diskfree 6j, 7a, min_diskfree 6h, 7a.
Uses: disk_capacity_onep 6b, maxfreespace_perc 2b, minfreespace_perc 2b.
If logging is on, print the numbers.
\langle find \ out \ free \ diskspace \ 6d \rangle \equiv
       ⟨ log variable (6e disk capacity
                                               ,6f disk_capacity ) 10 >
       \langle log variable (6g minimal required ,6h min_diskfree ) 10 \rangle
       ⟨ log variable (6i safe minimum
                                              ,6j \max_{diskfree}) 10
Fragment defined by 6abcd.
Fragment referenced in 5c.
Uses: max_diskfree 6c.
```

# 2.2 Determine whether quota should be expanded or reduced

Varianble change is going to indicate whether we have to increase or decrease quota.

#### 2.3 Change the quota

If we have to change the quota, we must first find out what the quota currently are, then calculate what the quota should be, and finally set the new quota.

If variable change tells us to increase the quota, we have to do the following:

- 1. Try to get the current quota from the file /usr/local/etc/kyotoquota and put it in variable old\_userquotum. It is the hard quota-limit of regular users. If that is not successful, set the variable to the maximum value that we allow.
- 2. Calculate a new value. Dependent of the contents of variable change, the new value is 5% more or 5% less that the value of old\_userquotum, with a maximum of 20% of the disk capacity.
- 3. Assign variable new\_hardquotum to the new quotum
- 4. Write new\_hardquotum in file /usr/local/etc/kyotoquota.
- 5. Calculate the "soft-quotum" for regular users and the "hard-quotum" and "soft-quotum" for students.
- 6. Apply the new quota.

Find the current hard-quotum setting for a regular user in file /usr/local/etc/kyotoquota. If the quota cannot be found there, set the quota to slighty less than the maximum quotum allowed.

8 2 THE SCRIPT

Slightly less to force updating the quota in the operating system when there is plenty of disk-space and /usr/local/etc/kyotoquota does not exist.

```
⟨ find out what the quota currently are 7c⟩ ≡
    retrieve_quota
    if
        [ "$old_userquotum" == "" ]
        then
            max_hardquotum=$((max_quota_perc*$disk_capacity_onep))
            old_userquotum=$((max_hardquotum-100))
        fi
            ◇
Fragment referenced in 7b.
Uses: disk_capacity_onep 6b, max_quota_perc 2a, old_userquotum 4b, retrieve_quota 4b.
```

If the quota should be reduced, multiply the current hard-quotum with the decrease-fraction. If the quota might possibly be increased, first look whether the quotum has not yet attained its max.

```
\langle calculate new quota 8a \rangle \equiv
      old_userquotum_onep=${old_userquotum%??}}
         [ "$change" == "Dec" ]
      then
         new_hardquotum=$((reduction_perc*old_userquotum_onep))
      else
        new_hardquotum=$((expansion_perc*old_userquotum_onep))
         max_hardquotum=$((max_quota_perc*$disk_capacity_onep))
           [ $new_hardquotum -gt $max_hardquotum ]
         then
           new_hardquotum=$max_hardquotum
      fi
       ⟨ log variable (8b max quotum
                                           ,8c max_hardquotum ) 10 >
      ⟨ log variable (8d new quotum
                                           ,8e \text{ new\_hardquotum}) 10
Fragment defined by 8afg.
Fragment referenced in 7b.
```

We have to set a soft-max and a quota for students. When a user occupies more diskspace than the the soft-max limit, she wil get warnings.

```
⟨ calculate new quota 8f⟩ ≡
    new_hardquotum_onep=${new_hardquotum%??}
    new_softquotum=$((soft_perc*$new_hardquotum_onep))
    ⋄
Fragment defined by 8afg.
Fragment referenced in 7b.
Uses: soft_perc 3a.

⟨ calculate new quota 8g⟩ ≡
    new_hardquotum_studs=$((10*$new_hardquotum_onep))
    new_softquotum_studs=$((8*$new_hardquotum_onep))
    ⋄
Fragment defined by 8afg.
Fragment referenced in 7b.
```

# 2.4 Activate new quota

Find the names of regular and student users and set the quota for each of them.

```
\langle activate\ new\ quota\ 9a \rangle \equiv
        while
           read line
        do
           \langle find \ username \ in \ line \ of \ password-file \ (9b \ line,9c \ user \ ) \ 3c \ \rangle
           \langle find\ group\text{-}id\ in\ line\ of\ password\text{-}file\ (9d\ \line,9e\ group\_id\ )\ 3d\ \rangle
             [ $group_id == $usergroup_id ]
             \langle set\ quota\ of\ a\ user\ (9f\ user,9g\ new_softquotum,9h\ new_hardquotum\ )\ 5b \rangle
             [ $group_id == $studgroup_id ]
           then
             \langle set\ quota\ of\ a\ user\ (9i\ user,9j\ new_softquotum_studs,9k\ new_hardquotum_studs\ )\ b\rangle
          fi
        done < /etc/passwd
Fragment defined by 9al.
Fragment referenced in 7b.
It seems that the quotacheck program has to be performed after modifying quota.
\langle activate \ new \ quota \ 91 \rangle \equiv
       quotaoff /
        quotacheck -vgum /
        quotaon /
Fragment defined by 9al.
Fragment referenced in 7b.
```

# 2.5 Logging

When the user gives argument -1, write a summary of the numbers.

First, find out whether the user gave the argument

Defines: quotacheck Never used, quotaon Never used.

```
    key = "$1"
    if
        [ "$key" == "-1" ]
        then
        logging="y"
    else
        logging="n"
    fi
```

Fragment referenced in 5c. Defines: logging 5c, 10.

The following macro prints a variable if logging is on:

# A How to read and translate this document

This document is an example of *literate programming* [2]. It contains the code of all sorts of scripts and programs, combined with explaining texts. In this document the literate programming tool nuweb is used, that is currently available from Sourceforge (URL:nuweb.sourceforge.net). The advantages of Nuweb are, that it can be used for every programming language and scripting language, that it can contain multiple program sources and that it is very simple.

#### A.1 Read this document

The document contains *code scraps* that are collected into output files. An output file (e.g. output.fil) shows up in the text as follows:

```
"output.fil" 4a \equiv
# output.fil
< a macro 4b >
< another macro 4c >
```

The above construction contains text for the file. It is labelled with a code (in this case 4a) The constructions between the < and > brackets are macro's, placeholders for texts that can be found in other places of the document. The test for a macro is found in constructions that look like:

#### A.2 Process the document

The raw document is named a\_kyotoquota.w. Figure 1 shows pathways to translate it into print-

Figure 1: Translation of the raw code of this document into printable/viewable documents and into program sources. The figure shows the pathways and the main files involved.

able/viewable documents and to extract the program sources. Table 1 lists the tools that are

```
Tool
        Source
                                      Description
gawk
        www.gnu.org/software/gawk/
                                      text-processing scripting language
M4
        www.gnu.org/software/m4/
                                      Gnu macro processor
        nuweb.sourceforge.net
                                      Literate programming tool
nuweb
tex
        www.ctan.org
                                      Typesetting system
                                      Convert TEX documents into xml/html
tex4ht
        www.ctan.org
```

Table 1: Tools to translate this document into readable code and to extract the program sources

needed for a translation. Most of the tools (except Nuweb) are available on a well-equipped Linux system.

```
\langle \ parameters \ in \ Makefile \ 11a \rangle \equiv $$ NUWEB=/usr/local/bin/nuweb $$ $$ $$ $$ $$ Fragment defined by 11a, 12b, 13ab, 15c, 18b, 21a. Fragment referenced in 11b. Uses: nuweb 17a.
```

#### A.3 Translate and run

This chapter assembles the Makefile for this project.

```
"Makefile" 11b\equiv \langle default target 11c\rangle \langle parameters in Makefile 11a, ...\rangle \langle impliciete make regels 14a, ...\rangle \langle expliciete make regels 12c, ...\rangle \langle make targets 15a, ...\rangle
```

The default target of make is all.

```
 \langle \ default \ target \ 11c \ \rangle \equiv \\  \quad \text{all} \ : \ \langle \ all \ targets \ 12a \ \rangle \\  \quad . \ PHONY \ : \ all   \diamondsuit  Fragment referenced in 11b. Defines: all Never used, PHONY 14b.
```

One of the targets is certainly the PDF version of this document.

```
\langle \ all \ targets \ 12a \ \rangle \equiv kyotoquota.pdf\diamondFragment referenced in 11c. Uses: pdf 15a.
```

We use many suffixes that were not known by the C-programmers who constructed the make utility. Add these suffixes to the list.

# A.4 Pre-processing

To make usable things from the raw input a\_kyotoquota.w, do the following:

- 1. Process \$ characters.
- 2. Run the m4 pre-processor.
- 3. Run nuweb.

This results in a LATEX file, that can be converted into a PDF or a HTML document, and in the program sources and scripts.

# A.4.1 Process 'dollar' characters

 $\langle expliciete make regels 12c \rangle \equiv$ 

Many "intelligent"  $T_EX$  editors (e.g. the auctex utility of Emacs) handle \$ characters as special, to switch into mathematics mode. This is irritating in program texts, that often contain \$ characters as well. Therefore, we make a stub, that translates the two-character sequence \\$ into the single \$ character.

```
m4_kyotoquota.w : a_kyotoquota.w
gawk '{if(match($$0, "@\")) {printf("\s", substr($$0,1,RSTART-1))} else print}' a_kyotoquota.u
| gawk '{gsub(/[\\][\\$$]/, "$$");print}' > m4_kyotoquota.w

Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
Uses: print 15a.

A.4.2 Run the M4 pre-processor

(explicite make regels 12d) =
kyotoquota.w : m4_kyotoquota.w
m4 -P m4_kyotoquota.w > kyotoquota.w

Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
```

#### A.5 Typeset this document

Enable the following:

- 1. Create a PDF document.
- 2. Print the typeset document.
- 3. View the typeset document with a viewer.
- 4. Create a HTMLdocument.

In the three items, a typeset PDF document is required or it is the requirement itself.

#### A.5.1 Figures

This document contains figures that have been made by xfig. Post-process the figures to enable inclusion in this document.

The list of figures to be included:

We use the package figlatex to include the pictures. This package expects two files with extensions .pdftex and .pdftex\_t for pdflatex and two files with extensions .pstex and .pstex\_t for the latex/dvips combination. Probably tex4ht uses the latter two formats too.

Make lists of the graphical files that have to be present for latex/pdflatex:

```
⟨ parameters in Makefile 13b⟩ ≡
    FIGFILENAMES=$(foreach fil,$(FIGFILES), $(fil).fig)
    PDFT_NAMES=$(foreach fil,$(FIGFILES), $(fil).pdftex_t)
    PDF_FIG_NAMES=$(foreach fil,$(FIGFILES), $(fil).pdftex)
    PST_NAMES=$(foreach fil,$(FIGFILES), $(fil).pstex_t)
    PS_FIG_NAMES=$(foreach fil,$(FIGFILES), $(fil).pstex)

♦
Fragment defined by 11a, 12b, 13ab, 15c, 18b, 21a.
Fragment referenced in 11b.
Defines: FIGFILENAMES Never used, PDFT_NAMES 15b, PDF_FIG_NAMES 15b, PST_NAMES Never used, PS_FIG_NAMES Never used.
Uses: FIGFILES 13a.
```

Create the graph files with program fig2dev:

```
\langle impliciete\ make\ regels\ 14a \rangle \equiv
      %.eps: %.fig
               fig2dev -L eps $< > $@
      %.pstex: %.fig
               fig2dev -L pstex $< > $@
       .PRECIOUS : %.pstex
      %.pstex_t: %.fig %.pstex
               fig2dev -L pstex_t -p $*.pstex $< > $0
      %.pdftex: %.fig
               fig2dev -L pdftex $< > $@
       .PRECIOUS : %.pdftex
      %.pdftex_t: %.fig %.pstex
               fig2dev -L pdftex_t -p $*.pdftex $< > $@
Fragment defined by 14a, 15b, 18c.
Fragment referenced in 11b.
Defines: fig2dev Never used.
```

#### A.5.2 Bibliography

To keep this document portable, create a portable bibliography file. It works as follows: This document refers in the |bibliography| statement to the local bib-file kyotoquota.bib. To create this file, copy the auxiliary file to another file auxfil.aux, but replace the argument of the command \bibdata{kyotoquota} to the names of the bibliography files that contain the actual references (they should exist on the computer on which you try this). This procedure should only be performed on the computer of the author. Therefore, it is dependent of a binary file on his computer.

# A.5.3 Create a printable/viewable document

Make a PDF document for printing and viewing.

```
⟨ make targets 15a⟩ ≡
    pdf : kyotoquota.pdf

print : kyotoquota.pdf
    lpr kyotoquota.pdf

view : kyotoquota.pdf
    evince kyotoquota.pdf

♦
Fragment defined by 15a, 18a, 21bc.
Fragment referenced in 11b.
Defines: pdf 12ab, 15b, print 3cd, 5a, 6a, 12c, view Never used.
```

Create the PDF document. This may involve multiple runs of nuweb, the LATEX processor and the bibTEX processor, and depends on the state of the aux file that the LATEX processor creates as a by-product. Therefore, this is performed in a separate script, w2pdf.

The w2pdf script The three processors nuweb, L4TeX and bibTeX are intertwined. L4TeX and bibTeX create parameters or change the value of parameters, and write them in an auxiliary file. The other processors may need those values to produce the correct output. The L4TeX processor may even need the parameters in a second run. Therefore, consider the creation of the (PDF) document finished when none of the processors causes the auxiliary file to change. This is performed by a shell script w2pdf.

Note, that in the following make construct, the implicit rule .w.pdf is not used. It turned out, that make did not calculate the dependencies correctly when I did use this rule.

The following is an ugly fix of an unsolved problem. Currently I develop this thing, while it resides on a remote computer that is connected via the **sshfs** filesystem. On my home computer I cannot run executables on this system, but on my work-computer I can. Therefore, place the following script on a local directory.

```
\langle explicite make regels 16a \rangle \equiv
      $(W2PDF) : kyotoquota.w
                $(NUWEB) kyotoquota.w
Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
"../nuweb/bin/w2pdf" 16b\equiv
      #!/bin/bash
      # w2pdf -- compile a nuweb file
      # usage: w2pdf [filename]
      # 20190524 at 1535h: Generated by nuweb from a_kyotoquota.w
      NUWEB=/usr/local/bin/nuweb
      LATEXCOMPILER=pdflatex
       ⟨ filenames in nuweb compile script 16d ⟩
       ⟨ compile nuweb 16c ⟩
      \Diamond
Uses: nuweb 17a.
```

The script retains a copy of the latest version of the auxiliary file. Then it runs the four processors nuweb, LATEX, MakeIndex and bibTEX, until they do not change the auxiliary file or the index.

```
⟨ compile nuweb 16c ⟩ ≡
    NUWEB=m4_nuweb
    ⟨ run the processors until the aux file remains unchanged 17b ⟩
    ⟨ remove the copy of the aux file 16e ⟩
    ♦
Fragment referenced in 16b.
```

The user provides the name of the nuweb file as argument. Strip the extension (e.g. .w) from the filename and create the names of the LATEX file (ends with .tex), the auxiliary file (ends with

```
.aux) and the copy of the auxiliary file (add old. as a prefix to the auxiliary filename).

⟨ filenames in nuweb compile script 16d ⟩ ≡
    nufil=$1
    trunk=${1%%.*}
    texfil=${trunk}.tex
```

auxfil=\${trunk}.aux
oldaux=old.\${trunk}.aux
indexfil=\${trunk}.idx
oldindexfil=old.\${trunk}.idx

Fragment referenced in 16b.

Defines: auxfil 17b, 20ab, indexfil 17b, 20a, nufil 17a, 20ac, oldaux 16e, 17b, 20ab, oldindexfil 17b, 20a, texfil 17a, 20ac, trunk 17a, 20acd.

Remove the old copy if it is no longer needed.

Run the three processors. Do not use the option -o (to suppres generation of program sources) for nuweb, because w2pdf must be kept up to date as well.

```
⟨ run the three processors 17a⟩ ≡
    $NUWEB $nufil
    $LATEXCOMPILER $texfil
    makeindex $trunk
    bibtex $trunk
    $

Fragment referenced in 17b.
Defines: bibtex 20cd, makeindex 20cd, nuweb 11a, 15cd, 16b, 19c.
Uses: nufil 16d, 20a, texfil 16d, 20a, trunk 16d, 20a.
```

Repeat to copy the auxiliary file and the index file and run the processors until the auxiliary file and the index file are equal to their copies. However, since I have not yet been able to test the aux file and the idx in the same test statement, currently only the aux file is tested.

It turns out, that sometimes a strange loop occurs in which the aux file will keep to change. Therefore, with a counter we prevent the loop to occur more than 10 times.

```
\langle run \ the \ processors \ until \ the \ aux \ file \ remains \ unchanged \ 17b \rangle \equiv
       LOOPCOUNTER=0
       while
         ! cmp -s $auxfil $oldaux
       do
         if [ -e $auxfil ]
         then
          cp $auxfil $oldaux
         fi
         if [ -e $indexfil ]
         then
          cp $indexfil $oldindexfil
         ⟨ run the three processors 17a ⟩
         if [ $LOOPCOUNTER -ge 10 ]
            cp $auxfil $oldaux
         fi;
       done
       \Diamond
Fragment referenced in 16c.
Uses: auxfil 16d, 20a, indexfil 16d, oldaux 16d, 20a, oldindexfil 16d.
```

### A.5.4 Create HTML files

HTML is easier to read on-line than a PDF document that was made for printing. We use tex4ht to generate HTML code. An advantage of this system is, that we can include figures in the same way as we do for pdflatex.

Nuweb creates a LATEX file that is suitable for latex2html if the source file has .hw as suffix instead of .w. However, this feature is not compatible with tex4ht.

Make html file:

Copy the bibliography.

```
\langle make\ targets\ 18a \rangle \equiv
      html: m4_htmltarget
Fragment defined by 15a, 18a, 21bc.
Fragment referenced in 11b.
The HTML file depends on its source file and the graphics files.
Make lists of the graphics files and copy them.
\langle parameters in Makefile 18b \rangle \equiv
       HTML_PS_FIG_NAMES=$(foreach fil, $(FIGFILES), m4_htmldocdir/$(fil).pstex)
       HTML_PST_NAMES=$(foreach fil,$(FIGFILES), m4_htmldocdir/$(fil).pstex_t)
Fragment defined by 11a, 12b, 13ab, 15c, 18b, 21a.
Fragment referenced in 11b.
Uses: FIGFILES 13a.
\langle impliciete\ make\ regels\ 18c \rangle \equiv
      m4_htmldocdir/%.pstex : %.pstex
                cp $< $@
      m4_htmldocdir/%.pstex_t : %.pstex_t
                cp $< $@
Fragment defined by 14a, 15b, 18c.
Fragment referenced in 11b.
Copy the nuweb file into the html directory.
\langle explicite make regels 18d \rangle \equiv
       m4_htmlsource : kyotoquota.w
                cp kyotoquota.w m4_htmlsource
Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
We also need a file with the same name as the documentstyle and suffix .4ht. Just copy the file
report.4ht from the tex4ht distribution. Currently this seems to work.
\langle\;expliciete\;make\;regels\;18e\;\rangle\equiv
       m4_4htfildest : m4_4htfilsource
                cp m4_4htfilsource m4_4htfildest
Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
```

```
\langle explicite make regels 19a \rangle \equiv
      m4_htmlbibfil : m4_anuwebdir/kyotoquota.bib
               cp m4_anuwebdir/kyotoquota.bib m4_htmlbibfil
Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
Make a dvi file with w2html and then run htlatex.
\langle explicite make regels 19b \rangle \equiv
      m4_htmltarget : m4_htmlsource m4_4htfildest $(HTML_PS_FIG_NAMES) $(HTML_PST_NAMES) m4_htmlbibfil
               cp w2html /home/paul/temp/kyotoquota/bin
               cd /home/paul/temp/kyotoquota/bin && chmod 775 w2html
               cd m4_htmldocdir && /home/paul/temp/kyotoquota/bin/w2html kyotoquota.w
Fragment defined by 12cd, 14b, 16a, 18de, 19ab.
Fragment referenced in 11b.
Create a script that performs the translation.
"w2html" 19c≡
      #!/bin/bash
      # w2html -- make a html file from a nuweb file
      # usage: w2html [filename]
      # [filename]: Name of the nuweb source file.
      '#' m4_header
      echo "translate " $1 >w2html.log
      NUWEB=/usr/local/bin/nuweb
      ⟨ filenames in w2html 20a ⟩
      ⟨ perform the task of w2html 19d ⟩
Uses: nuweb 17a.
```

The script is very much like the w2pdf script, but at this moment I have still difficulties to compile the source smoothly into HTML and that is why I make a separate file and do not recycle parts from the other file. However, the file works similar.

The user provides the name of the nuweb file as argument. Strip the extension (e.g. .w) from the filename and create the names of the LATEX file (ends with .tex), the auxiliary file (ends with .aux) and the copy of the auxiliary file (add old. as a prefix to the auxiliary filename).

```
\langle filenames in w2html 20a \rangle \equiv
       nufil=$1
       trunk=${1\%.*}
       texfil=${trunk}.tex
       auxfil=${trunk}.aux
       oldaux=old.${trunk}.aux
       indexfil=${trunk}.idx
       oldindexfil=old.${trunk}.idx
Fragment referenced in 19c.
Defines: auxfil 16d, 17b, 20b, nufil 16d, 17a, 20c, oldaux 16de, 17b, 20b, texfil 16d, 17a, 20c, trunk 16d, 17a,
Uses: indexfil 16d, oldindexfil 16d.
\langle run \ the \ html \ processors \ until \ the \ aux \ file \ remains \ unchanged \ 20b \ \rangle \equiv
       while
          ! cmp -s $auxfil $oldaux
       do
         if [ -e $auxfil ]
         then
          cp $auxfil $oldaux
         fi
         \langle \mathit{run} \ \mathit{the} \ \mathit{html} \ \mathit{processors} \ 20c \, \rangle
       done
       ⟨ run tex4ht 20d ⟩
Fragment referenced in 19d.
Uses: auxfil 16d, 20a, oldaux 16d, 20a.
To work for HTML, nuweb must be run with the -n option, because there are no page numbers.
\langle run \ the \ html \ processors \ 20c \rangle \equiv
       $NUWEB -o -n $nufil
       latex $texfil
       makeindex $trunk
       bibtex $trunk
       htlatex $trunk
Fragment referenced in 20b.
Uses: bibtex 17a, makeindex 17a, nufil 16d, 20a, texfil 16d, 20a, trunk 16d, 20a.
When the compilation has been satisfied, run makeindex in a special way, run bibtex again (I
don't know why this is necessary) and then run htlatex another time.
\langle run \ tex4ht \ 20d \rangle \equiv
       tex '\def\filename{{kyotoquota}{idx}{4dx}{ind}} \input idxmake.4ht'
       makeindex -o $trunk.ind $trunk.4dx
       bibtex $trunk
       htlatex $trunk
Fragment referenced in 20b.
Uses: bibtex 17a, makeindex 17a, trunk 16d, 20a.
```

create the program sources Run nuweb, but suppress the creation of the LATEX documentation. Nuweb creates only sources that do not yet exist or that have been modified. Therefore make does not have to check this. However, "make" has to create the directories for the sources if they do not yet exist. So, let's create the directories first.

```
\langle parameters in Makefile 21a \rangle \equiv
       MKDIR=mkdir -p
Fragment defined by 11a, 12b, 13ab, 15c, 18b, 21a.
Fragment referenced in 11b.
Defines: MKDIR 21b.
\langle make \ targets \ 21b \rangle \equiv
       DIRS=\langle directories to create 15d \rangle
       $(DIRS) :
                  $(MKDIR) $@
Fragment defined by 15a, 18a, 21bc.
Fragment referenced in 11b.
Defines: DIRS 21c.
Uses: MKDIR 21a.
\langle make\ targets\ 21c \rangle \equiv
       sources : kyotoquota.w $(DIRS)
                  $(NUWEB) kyotoquota.w
                  cd .. && chmod 775 adaptquota
       jetty : sources
                  cd .. && mvn jetty:run
Fragment defined by 15a, 18a, 21bc.
Fragment referenced in 11b.
Uses: DIRS 21b.
```
